

Sessions

 **Fix Me!** A1 proofreading not yet effective for this page. In the meantime, you can ask any questions on the [forum](#).

At fixed intervals, the Gestan executable writes to the sessions file, to indicate that the current executable is “alive”.

At the same time, it checks the same file for the date/time of the last write of other executables in progress. If a discrepancy of more than 10 minutes is found, it destroys the session in the record. The executable concerned will then be asked to close.

Using the screen

```
/**Access : ** Tools → Administration → Users → Sessions **
```

This screen displays the active sessions of users connected to Gestan.

[illegible]

The **Deconn Sess** button disconnects the selected session, while the **Deconn All** button initiates a general disconnection. General disconnection takes effect within 2 minutes. The screen allows you to track the progress of disconnections.
